Introduction

Gender-Based Violence is a major health problem around the world. It often goes unnoticed and undocumented partly due to its taboo nature. It is an important cause of morbidity and mortality among women. There is a close association between violence and women’s health and the consequence is in nature of physical health, reproductive health, mental health, and child health, accessibility and utilization of health care services. The high prevalence of violent situations indicates the urgency of incorporating an approach which deals with gender violence and promotes the empowerment of women into the routine of reproductive health services. Although the healthcare system is often the first point of contact for victims for treatment, and care, there is an inadequacy of healthcare response towards them. In such a situation, a low rate of detection of domestic violence by health professionals is a cause for concern, and thus, achieving the vision of SDG will be a limitation.

The effect of violence on health of the mothers requires appropriate interventions to avoid or minimize the effects of violence on the health of the mothers and the babies. In order to prevent the effect of domestic violence, all mothers should be routinely screened by ASHA and later by health professionals for the experience of violence, both lifetime and during pregnancy. At the policy level, concerted efforts are need to combat gender-based violence not only as a human rights issue but as a major risk factor for poor maternal and newborn health. Above all, there is a need to understand how the implementations of policies required by women’s health and empowerment processes are shaped by the state response.

Despite the constitutional guarantee of justice- equality and dignity; women’s responses to partner abuse are shaped by their particular socio-cultural contexts and they by and large prefer to remain voiceless. There are several initiatives taken by various institutions, international commitments and global campaign on prevention of violence. Consistent with SDG to eliminate all forms of violence against women and girls, there is a need to expand opportunities and ensure equal distribution of opportunities and health outcomes as a fundamental to a sustainable trajectory of human development perspective. The health challenges and harness equal opportunities and outcomes for women in the inclusive and faster growth processes, the Government of India designed various policies strategies and programmes.

In the 12th Five-Year Plan, there was focus on training of medical personnel at the levels of the healthcare system to recognize and report violence against women and children. In absence of any systemic engagement of health professionals about the evidence based intervention, the Act has to percolate from national level to the grass root level. There is a need for health professional role on the part of advocacy and treatment of women with history of facing violence. The aim of this training course is to enhance the capacity of key stake holders in the area of national collaborative strategy for prevention of gender violence through effective uses of human rights to protect health of women and children and to influence appropriate policy planning, developmental aspects and strategic management in their daily work.
